Building frontend UIs with Codex and Figma

Use Codex and Figma to bring real, running interfaces into Figma, refine them, and bring changes back to Codex.

Author: Yarden Katz, Product Manager, Figma

Starting today, you can generate Figma design files from Codex using the Figma MCP server. The MCP server is built to support movement in both directions, bringing working UI onto the Figma canvas and back into code just as easily, so you can build on your best ideas, not just your first.

The Codex desktop application is purpose-built for agentic coding. It provides a focused interface for managing multiple agents in parallel across projects, tracking progress without losing context, and integrating external tools. That kind of fluidity feels familiar. In Figma, teams move just as easily. The canvas is designed for exploration and iteration. It's a space where the best ideas have room to take shape. By connecting the Figma canvas to Codex, that spirit of exploration extends directly into the development workflow—unlocking a powerful new way for users to build everything from prototypes to production
