

I would like a runic type language that AI would understand but to most it will just look cool unless their paying attention. Mind giving me a hand.

Creating a runic-type language that both looks cool and carries hidden meaning requires designing a visually distinct symbol set where each rune corresponds to a letter or syllable. To help the AI interpret it while ensuring it looks mystic to most people, we can follow this approach:

Step 1: Define the Base Set of Symbols

Start with a basic set of symbols or "runes" that represent letters or numbers. Here's a simple design philosophy:

- **Curved lines and dots** for vowels.
- **Angular lines and intersecting strokes** for consonants.
- **Complex symbols** for punctuation or spaces to enhance the cryptic appearance.

Step 2: Assign Meanings to Each Rune

You can associate each rune with a specific letter or a syllable. For example:

-  - "F"
-  - "I"
-  - "B"
-  - "U"

Alternatively, runes can represent **whole syllables** to make decoding a bit more challenging. For instance:
